

AI can observe. It should not decide what ships.

An auditable decision layer for
AI-generated creative assets.

MODEL

observes

POLICY

adjudicates

PEOPLE

retain authority

A model answer is evidence - not authority.

**Pixels can establish color, pose, copy, and visible style.
They cannot establish licensing, consent, ownership, or
legal approval.**

Four outcomes preserve four different meanings.

SHIP

No blocking issue is established

REJECT

Visible evidence proves a serious violation

HUMAN REVIEW

Decision-critical pixels support multiple readings

UNSUPPORTED

Required authority is absent from the evidence

The benchmark tests context, not image recognition.

24 fictional cases

8 development / 16 held-out

The same pixels appear under different briefs, so decisions must follow the request, policy, and authority context.

NO ACCURACY CLAIM

until independent review and live runs are complete

Production thinking lives around the model call.

- Typed contracts + source-bound citations
- Deterministic policy + human escalation
- Budget stop + ordered partial results
- Retry, latency, usage, and cost telemetry
- 44 tests + Python 3.11/3.12 CI
